I am a student of Structural Engineering at the City College of New York--a college that--to all those who have been--is known for its extreme academic rigor in the fields of engineering. The course CE332: Mechanics of Deformable Bodies is THE hardest class in our major, often requiring students to take 2 and even 3 times over until they manage the passing grade of D or slightly higher. The passing rate is approximately 20-25%. The reason for this is that the exams are NOTHING like the Beer and Johnston book we use in class. After barely failing the class the first time (but having a near perfect academic record besides that), i took it upon myself to find ALL the material i possibly could in order to outsmart the professors and do well for once on their IMPOSSIBLE exams. In this search i came across the 2nd Edition of this book, written by Stephen Timoshenko, the father of

Engineering Mechanics in the U.S. I promptly got a copy for \$10. It was the best engineering textbook i had yet to see. Despite being old, the textbook was very clear, precise, and easy to understand. Both theory, history, and solved problems were explained with amazing enthusiasm and clarity. But the BEST aspect was the problems given at the end of the chapters. MUCH more difficult than those in Beer and Johnston, and exhibiting a wide array of ingenious applications of the theory, this book's problem set helped me very adequately prepare for the coursework in CE332. As engineerings, our job is to ANALYZE systems. This book, with its problems and its approach, is geared towards helping you attain this skill of ANALYSIS. For the truly passionate structural engineer, the problems within this book will be not only appetizing, but exciting (although oftentimes you'll be banging your head against the wall).
